Have fun with this little experiment!

1. Half fill a glass of water and gently lower the egg into the glass.
   What happened to the egg? Does it sink or float?

2. Half fill another glass of water. Stir in 6 tablespoons of salt. Carefully fill the remainder of the glass with water until the glass is almost full. (try not to disturb or mix the salty water with the plain water)
   Gently lower the egg into the water.
   What happened to the egg? Does it sink or float?

Why do you think this happened?
